Dear Sir:-

Your letter of Feb. 10.

The fireball, asteroid or meteorite that fell at 1.05 in the morning of Saturday 8, in a zone south of this city, between Parral and a little community called Pueblito de Allende, about 200 hundred miles south of Chihuahua, has been already investigated by Dr. Albert King, with a Harvard degree on the matter and send by NASA from Houston's Spacial Center.

Dr. King is back again in Houston, where he is studing fragments of the meteor; previously, they were analyzed by metalurgist of the American Smelting and Refining Co., in mining town of Parral: it is a dark grey material, granitic type with many porous, and white lines of silice; also with points or grains of iron and bronz.-The bronz grains, as said by Dr. King, could mean that it was human made satellite, that brouzed the moon, detouring ~~to the earth~~ to the earth, where it exploded at low altitud,--probably a sonic explosion,--leaving hundreds of fragments that have been found on the trail of the meteor. We had a couple of them, one of about 16 lbs. and the other one 32 lbs that we had examined by the Chihuahua Nuclear Comission, and were told that the radiation is only ~~MMM~~ 0.03 Milli-Rangens; not dangerous.

Also came to Chihuahua, one cientist send by Russian Embassy in México and a TASS agency correspondence; what they found out, we don't now, because they never talk to anybody.-

Up to today, no crater has been found; that means that the meteor, asteroid or ~~MMMM~~ satellite, never reached the ground, and disolved in fragments of many sizes, the heaviest one, up to now, that weighs nearly 30 Lbs.

If you wish a fragment of this "fire-ball", you can write to:

José Rocha
Police Inspector
Hidalgo del Parral, Chih., Mex.

He has many of them; the ones we picked up were given to the nuclear Comission, that send them to México City for further investigation.

As you can see, my english is not very good; it is terrible; I hope you will understand the contains of

Dear Sir:-

Your letter of Feb. 10.

The fireball, asteroid or meteorite that fell at 1.05 in the morning of Saturday 8, in a zone south of this city, between Peral and a little community called Piedrito de Alamos, about 200 hundred miles south of Chihuahua, has been already investigated by Dr. Albert King, with a Harvard degree on the matter and sent by NASA from Houston's Special Center.

Dr. King is back again in Houston, where he is studying fragments of the meteor; previously they were analyzed by members of the American Smelting and Refining Co., in mining town of Peral: it is a dark grey material, granitic type with many pores, and white lines of silice; also with points of grains of iron and bronze. The porous grains, as said by Dr. King, could mean that it was human made satellite, that produced the moon, descending to the earth, where it exploded at low altitude,--probably a sonic explosion,--leaving hundreds of fragments that have been found on the trail of the meteor. We had a couple of them, one of about 15 lbs. and the other one 32 lbs. that we had examined by the Chihuahua Nuclear Commission, and were told that the radiation is only 0.03 Milli-Rentgen; dangerous.

Also came to Chihuahua, one scientist sent by Russian Agency in Mexico and a TASS agency correspondence; what they found out, we don't now, because they never talk to anybody. Up to today, no crater has been found; that means that the meteor, asteroid or satellite, never reached the ground and dissolved in fragments of many sizes, the heaviest one, up to now, that weighs nearly 30 lbs.

If you wish a fragment of this "fire-ball", you can write to: José Rocha, Police Inspector, Hidalgo del Peral, Chih., Mex. He has many of them; the ones we picked up were given to the Nuclear Commission, that send them to Mexico City for further investigation.

As you can see, my English is not very good; if it is terrible; I hope you will understand the contents of
