

4. Bacubirito, Mexico: Estimated weight: 22 tonnes

Photographer unknown via [Meteorite Art](#)

The great Bacubirito meteorite is undoubtedly Mexico's finest and one of the largest single space objects to have been sent on a collision course with the Earth and survived. Estimated to weigh 22 tonnes, this crooked, four-metre-long slab of iron is on display at the Centro de Ciencias de Sinaloa in Culiacan, where it draws visitors keen to measure up against it.
