

DAR AL GANI 298

LL4

Found 1997

26° 58.20' N., 16° 42.28' E.

A mass totaling 2,459 g was found in the Libyan Desert. This petrologic group 4 amphoterite is the least represented type among the ordinary chondrites. This meteorite has a very fresh appearance with a weathering grade of W0 and is rich in noble gases suggesting a very recent fall. The above specimen of DaG 298 is a 28.9 g partial slice.
