

Deport, Texas,

Sept. 8, 1933.

Mr. Osear E. Monnig,  
312 W. Leuda,  
Ft. Worth, Texas.

Dear Mr. Monnig:

I am sorry to learn that the so-called fragment of meteorite was too stubborn to yeild even a nickel element to your chemical test. Just why it persists in showing stubbornness in preference to the much desired nickel is completely beyond my powers of comprehension.

Of the two, I would accept your judgement to that of the editor, but I am glad you sent it to an expert. Yes, sir, pure glad!

We will move to dad's old home place next year, and I have hopes of finding many interesting specimens of rock, etc. However, I shall certainly examine them for symptoms of stubbornness before submitting them to you. The idea of a meteorite (?) manifesting this most undesirable and peculiarly human idiosyncrasy is intolerable. Yes, quite!

Assuring you that curiousness in regards to this specimen is mutual, I am

Sincerely,

Route 2

Edgar L. Bryson

P.S. I do not know what became of that grayish matter, which was originally between the prongs.
