

1968, Feb. 5.

Mr. H. V. Schulz,  
2402 Sinclair St.  
Midland, Texas.

Dear Mr. Schulz:

I am still quite interested in the stony meteorite you have. It has been over a year since I wrote you about it.

I want to emphasize the fact that I am still most anxious to secure the main mass for our collection. We would exhibit it either at Texas Christian University or at the Children's Museum here, which is quite an institution. Many people would see it and it would do good in that way.

I know your attachment for it and your sentimental feelings (since your father found it) tend to outweigh mere monetary considerations, but I can offer you \$200.00 for it, so keep that in mind. I never got any result from trying to trace the fragment in Dallas.

It is beginning to look less and less like these things come from the lunar surface. The belief that they are scraps of a broken asteroid with an orbit going out between Mars and Jupiter is apparently strengthening. The type you have is the commonest stony variety, but the pittings on your specimen are mighty good and make it a desirable piece for exhibit. Be sure to guard it so it doesn't get "bunged up", if I may offer a suggestion.

Yours sincerely,
