

1975 June 8

Dear Glenn:

57 years ago today I had one of my first astronomical disappointments. I tried to watch an eclipse of the sun from here and it got cloudy! That eclipse was total across Oklahoma but I didn't have the gumption or the money to go up there to see it!

Thanks for your prompt answer to my recent letters. There is still some mystery about this Haven business, because the stone I have is quite complete and has never been cut. I am hypothesizing that this same man found two stones. As I told you in my first letter, the stone here has two faces that were broken in flight and poorly healed.

I have a U. S. G.S. Wichita sheet but am having trouble locating the limits of the ranges and townships thereon. When I get this straightened out I'll confer with the people here who had the stone and get this location business accurately straightened out. Thanks for your tip on the meaning of "P.M."

I'll check with Carleton as you suggest but as there is no cut surface on mine the main thing I can get from him is some information in general. If there were two stones I am wondering what became of the main mass of the first find that Stockwell says was in "Westfell's" possession to the extent of 5 $\frac{1}{2}$ (pounds). Maybe it never got into any collection and is lost.

I spent another day yesterday on the Jan 9th fireball, part of the time in actual searching, but all still to no avail.

Sincerely,
