The Geology Department is displaying a meteorite in the Museum. They need the help of any one who can furnish information as to where it was found.

This stony meteorite was in the collections of the late Dr. J. E. Hawkins. He taught German classes at Baylor University till his retirement in 1964. His avocation <sup>making</sup> was/field trips in search of Indian artifacts.

Somehow, in the course of these outings, he must have either found this very typical stony meteorite or obtained it from the original finder.

But none of his family or friends who have been contacted know when, where or by whom this well preserved meteorite was found. As a matter of scientific information we are anxious to know. The stone seems to have been on earth only a relatively short time because the exterior <sup>only slightly</sup> crust is ~~not~~ oxidized. It weighs about 11 3/4 pounds.

Possibly he spoke of it to some of his students or some of the faculty. We are appealing to any one who might know anything about the object to contact <sup>Dr. Bayce</sup> Mr. Brown at the Museum.
