**Northwest Africa 3137 (NWA 3137) Basaltic Eucrite, Morocco, and
Northwest Africa 3138 (NWA 3138) Basaltic Eucrite, Morocco**

This letter is a private/placement offering regarding the above-referenced, unpaired eucrites. The attachments contain the eucrite descriptions, which are being published in Meteoritical Bulletin 89, and separate proposed offers for each eucrite, as they were acquired separately. Also attached are separate photographic and descriptive pages showing the front and reverse of each specimen offered. Both main masses are also available, but I have not weighed or photographed the NWA 3138 main mass at this time. I will provide this information upon request.

The eucrites were sliced by Marvin Killgore in August/September using his wire saw. The result is outstanding. Each specimen prepared is very aesthetic and resulted in museum quality slices. The few number of slices is my suggestion and my effort in trying to yield the highest quality and largest surface-area specimens.

I am not offering these specimens to the general public and I will not attempt to sell them in whole or in part on eBay or other retail sales basis. Rather, I have decided to selectively offer these specimens to individuals and institutions I feel would appreciate them, want one for their collections, and/or wish to acquire one or more for trade or retail sales purposes.

Should you have any comments or questions, please do not hesitate to call or write.

Very truly yours,

Philip C. Mani
